

# Support Search Using Apache Solr

Indexing and Querying

Jigar M. Pandya  
Assistant Professor  
Computer Engineering Dept., FoT.  
D.D.University, Nadiad.

# Search

The most used computing operation

Basic Algorithms : Linear Search, Binary Search, Hashing, etc.

Search Engines : Altavista, Google, Bing, etc.

Enterprise Search: Apache Lucene/Solr (Open Source)

# About Lucene

<https://lucene.apache.org>

Lucene Core is a Java library providing powerful indexing and search features, as well as spellchecking, hit highlighting and advanced analysis/tokenization capabilities. The PyLucene sub project provides Python bindings for Lucene Core.

# About Solr

<https://lucene.apache.org>

Solr is a high performance search server built using Lucene Core. Solr is highly scalable, providing fully fault tolerant distributed indexing, search and analytics. It exposes Lucene's features through easy to use JSON/HTTP interfaces or native clients for Java and other languages.

# About Solr ...

<https://lucene.apache.org/solr/features.html>

Solr is a standalone enterprise search server with a REST-like API. You put documents in it (called "indexing") via JSON, XML, CSV or binary over HTTP. You query it via HTTP GET and receive JSON, XML, CSV or binary results.

# How Solr Sees the World

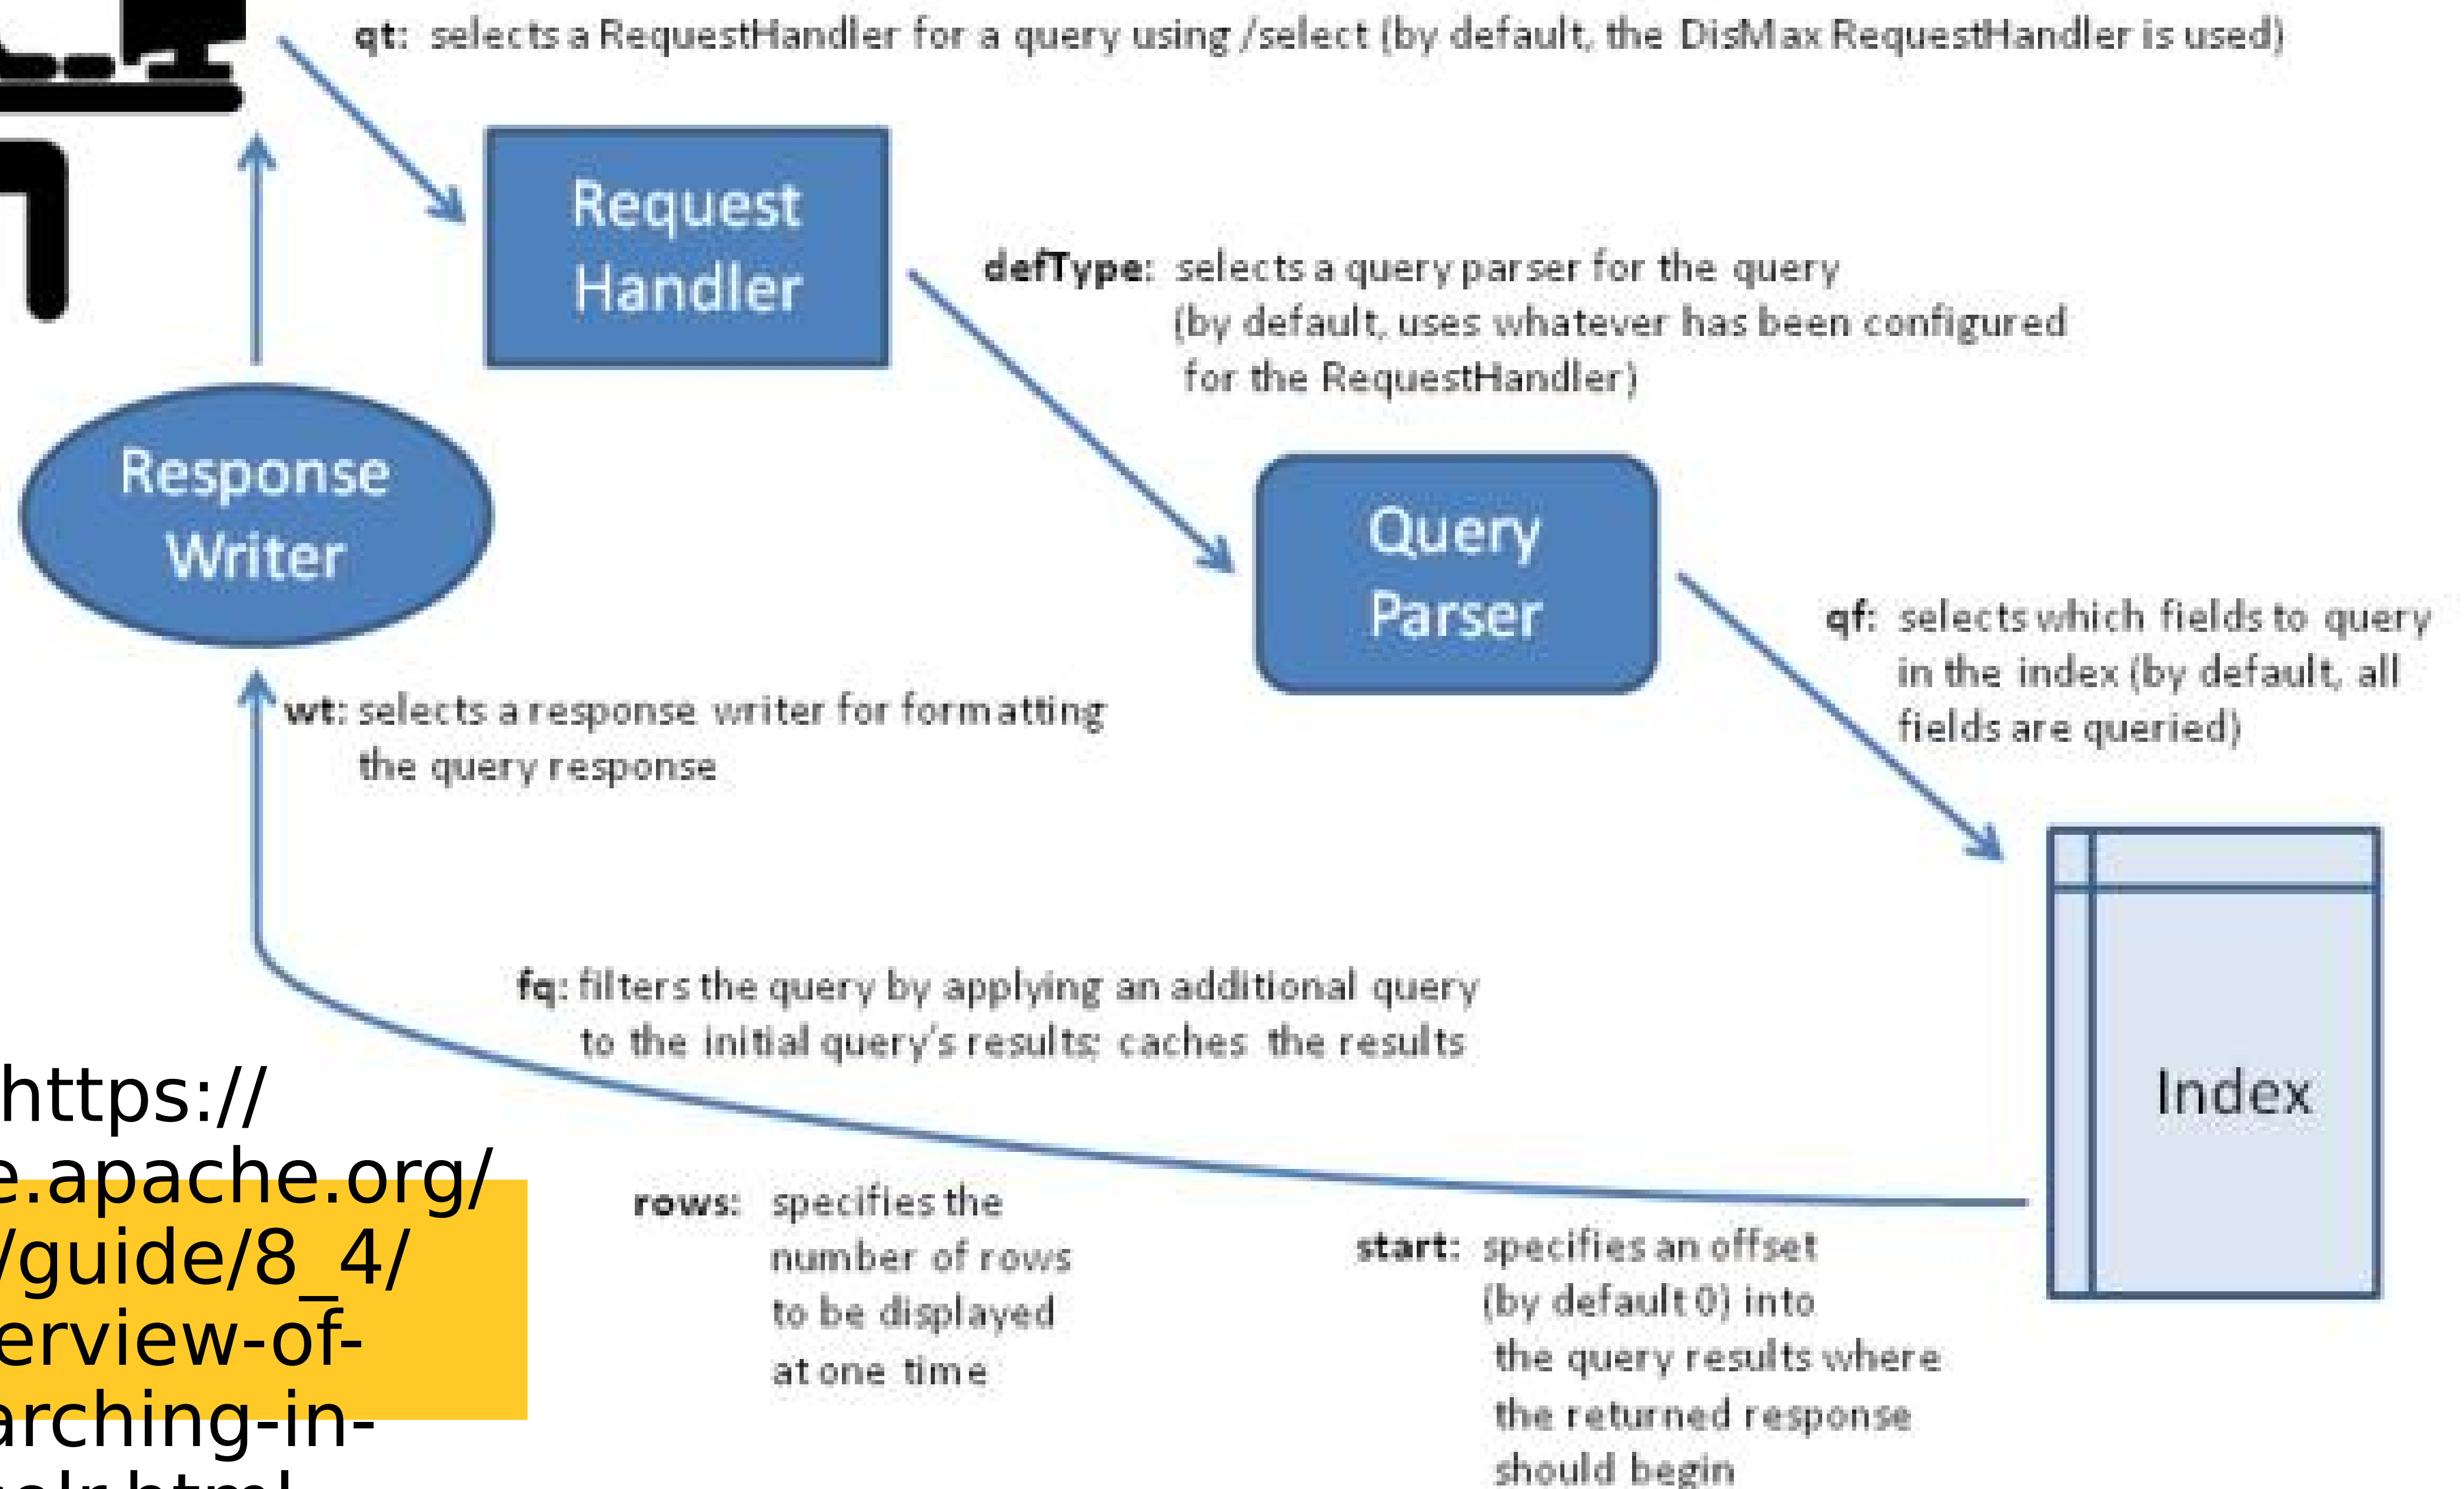

[https://lucene.apache.org/solr/guide/8\\_4/overview-of-documents-fields-and-schema-design.html](https://lucene.apache.org/solr/guide/8_4/overview-of-documents-fields-and-schema-design.html)

Solr's basic unit of information is a ***document***, which is a set of data that describes something. Documents are composed of ***fields***, which are more specific pieces of information.

When you add a document, Solr takes the information in the document's fields and adds that information to an **index**.

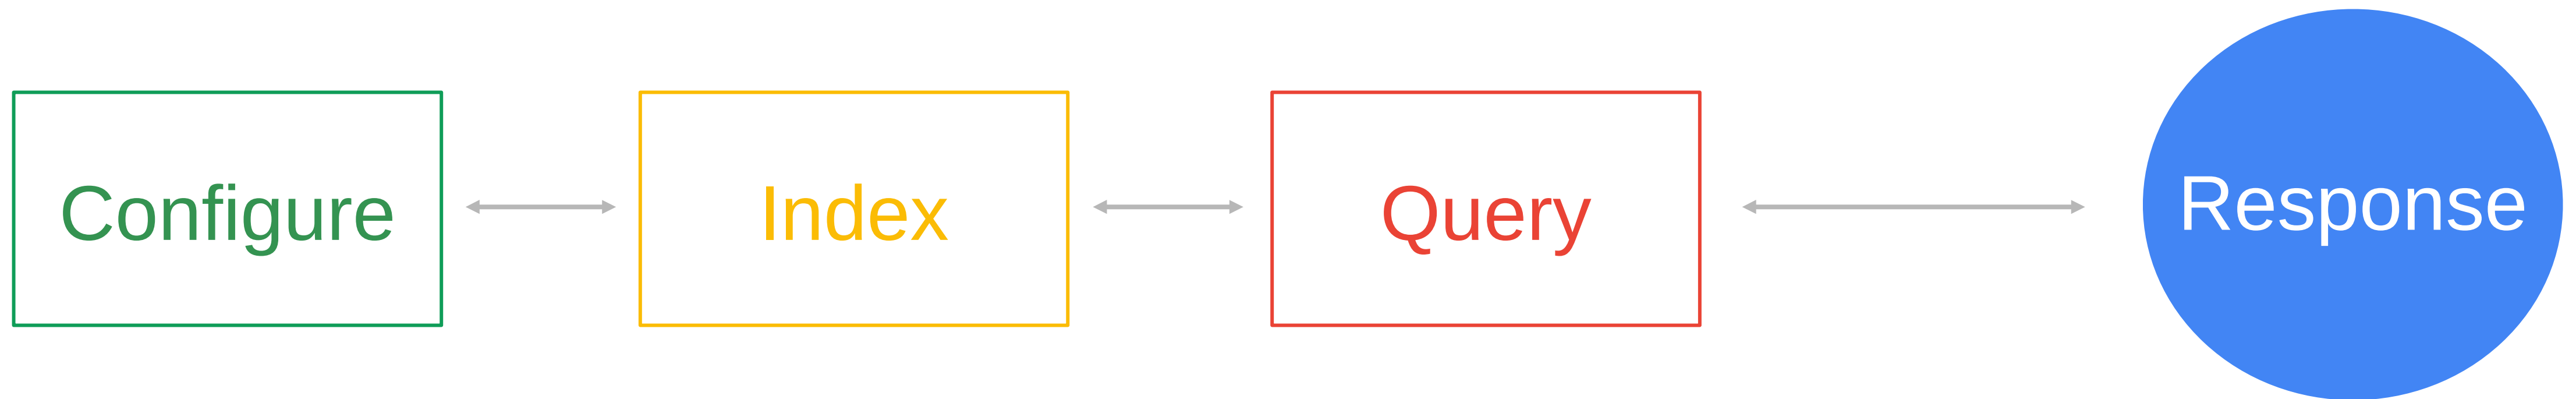

When you perform a **query**, Solr can quickly consult the index and return the matching documents.

[https://lucene.apache.org/solr/guide/8\\_4/overview-of-searching-in-solr.html](https://lucene.apache.org/solr/guide/8_4/overview-of-searching-in-solr.html)

# High Level Steps

*Full Indexing first time*

*Delta indexing nightly*

*or Near Real Time integration by SolrJ like APIs.*

# Installing Solr

## Administration

```
sudo tar xvzf solr-8.4.1.tgz --directory=/opt/  
sudo ln -s /opt/solr-8.4.1/bin/solr /usr/local/bin  
sudo chown -R JigarPandya:staff /opt/solr-8.4.1
```

```
solr start
```

```
solr status
```

```
solr stop --all
```

```
solr -e techproducts
```

# Indexing Structured Data

[https://lucene.apache.org/solr/guide/8\\_4/uploading-structured-data-store-data-with-the-data-import-handler.html#uploading-structured-data-store-data-with-the-data-import-handler](https://lucene.apache.org/solr/guide/8_4/uploading-structured-data-store-data-with-the-data-import-handler.html#uploading-structured-data-store-data-with-the-data-import-handler)

full-import

A Full Import operation can be started with a URL

`http://localhost:8983/solr/dih/dataimport?command=full-import.`

delta-import

For incremental imports and change detection. Only the [SqlEntityProcessor](#) supports delta imports.

`http://localhost:8983/solr/dih/dataimport?command=delta-import.`

db-data-config.xml

```
last_modified > '${dataimporter.last_index_time}'
```

# Accessing Solr

## Over HTTP

- Admin
  - <http://localhost:8983/solr/#/>
- Select
  - <http://localhost:8983/solr/techproducts/select?q=DDR>
- Browse
  - <http://localhost:8983/solr/techproducts/browse?q=DDR>
- Schema
  - <http://localhost:8983/solr/techproducts/schema>
  - <http://localhost:8983/solr/techproducts/schema/fields>

# Technical Words

[https://lucene.apache.org/solr/guide/8\\_4/solr-glossary.html](https://lucene.apache.org/solr/guide/8_4/solr-glossary.html)

- Core
  - An individual Solr instance (represents a logical index). Multiple cores can run on a single node.
- Collection
  - In Solr, one or more [Documents](#) grouped together in a single logical index using a single configuration and Schema.
  - In [SolrCloud](#) a collection may be divided up into multiple logical shards, which may in turn be distributed across many nodes, or in a Single node Solr installation, a collection may be a single [Core](#).

# Technical Words

[https://lucene.apache.org/solr/guide/8\\_4/solr-glossary.html](https://lucene.apache.org/solr/guide/8_4/solr-glossary.html)

- Facet
  - The arrangement of search results into categories based on indexed terms
- Replica
  - A Core that acts as a physical copy of a Shard in a SolrCloud Collection.
- Shard
  - In SolrCloud, a logical partition of a single Collection. Every shard consists of at least one physical Replica, but there may be multiple Replicas distributed across multiple Nodes for fault tolerance. See also SolrCloud.
- Suggester
  - Functionality in Solr that provides the ability to suggest possible query terms to users as they type.
